It all began in 1919, when a mysterious swine fever outbreak swept through England. The disease, known as Teschen disease, spread rapidly, killing thousands of pigs and threatening the nation's entire livestock industry.

Desperate for help, the British government reached out to the United States, which had also been battling swine fever outbreaks for years. At the time, the United States Department of Agriculture (USDA) was led by a brilliant scientist named John Mohler. Mohler had dedicated his career to studying swine diseases, and he was determined to find a way to stop the spread of Teschen disease.

Mohler and his team quickly assembled a team of experts and set out for England. They worked closely with British scientists to study the disease and develop a vaccine. Within months, they had made a breakthrough. The vaccine was effective in preventing Teschen disease, and it was quickly distributed to farmers throughout England. The outbreak was stopped, and the nation's livestock industry was saved.

The collaboration between England and America did not end with the eradication of Teschen disease. Mohler and his team continued to work with British scientists to develop new and improved vaccines for other swine diseases. This collaboration led to a number of groundbreaking medical breakthroughs, which benefited both countries and helped to improve the health of swine worldwide.

The story of how porcine tragedy taught England and America to share is a powerful reminder of the importance of international collaboration. When scientists and researchers work together, they can achieve great things that would be impossible for them to accomplish on their own.

## **The Legacy of the Porcine Tragedy**

The transatlantic collaboration that led to the development of the Teschen disease vaccine had a profound impact on the world. It not only saved the lives of countless pigs, but it also helped to improve the health of humans. The vaccine was later used to control swine fever outbreaks in other countries, and it is still used today to protect pigs from this deadly disease.

The collaboration between England and America also paved the way for future scientific partnerships. In the years since the porcine tragedy, scientists from around the world have worked together to fight other

diseases that threaten both humans and animals. This collaboration has led to the development of new vaccines, treatments, and diagnostic tools that have saved countless lives.

The porcine tragedy is a reminder that even in the darkest of times, hope can be found. Through collaboration and sharing, we can overcome even the greatest challenges and achieve great things.
